Today, ultrasonic testing is the standard method of nondestructive testing for rails. Data from testing equipment is relayed to the NDT technician inside the inspection car. The inspection car stops wherever a defect is detected. Then, the technician gets out and tests the rail by hand to verify the defect.

Nondestructive Testing (NDT) in Rail Inspection

ASTM's nondestructive testing standards provide guides for the appropriate methods and techniques used to detect and evaluate flaws in materials and objects without destroying the specimen at hand. Such tests include radiographic, ultrasonic, electromagnetic (eddy-current), X-ray, acoustic, and tomographic techniques.
