While the neutral theory does not deny that natural selection may be important in adaptive evolutionary change, it does claim that natural selection accounts for a very small fraction of genetic evolution. A dramatic consequence now follows. Most evolutionary change at the genetic level is not adaptive.

George C. Williams `Adaptation and Natural Selection' (ANS) is subtitled `A critique of some current evolutionary thought' but is much more than just a challenge to what Williams thinks is biology gone astray. It is a landmark treatise on adaptations and a masterful revision of the current status of natural science.

The core of Darwin's theory is natural selection, a process that occurs over successive generations and is defined as the differential reproduction of genotypes. Natural selection requires heritable variation in a given trait, and differential survival and reproduction associated with possession of that trait.
