If you have more than you need, this is the reagent in excess (xs). If you have less than you need, this is the limiting reagent (LR). You have 0.20 mol of C a (O H) 2 and you need 0.17 mol C a (O H) 2. This reagent is in xs.

Chlorine, therefore, is the limiting reactant and hydrogen is the excess reactant . Figure 2. When H 2 and Cl 2 are combined in nonstoichiometric amounts, one of these reactants will limit the amount of HCl that can be produced. This illustration shows a reaction in which hydrogen is present in excess and chlorine is the limiting reactant.

To identify the limiting reactant, calculate the number of moles of each reactant present and compare this ratio to the mole ratio of the reactants in the balanced chemical equation. The maximum amount of product(s) that can be obtained in a reaction from a given amount of reactant(s) is the theoretical yield of the reaction.

There are many ways to teach students how to identify limiting reactants via calculations. One popular method is the "Before, Change and After" (BCA) chart. In a BCA, the starting moles, change in moles (determined using the proportions indicated by the balanced equation coefficients), and final moles are recorded in a table.
